On the complexity of irrational numbers under different representations

Ivan Georgiev

Prof. Asen Zlatarov University, Burgas, Bulgaria

Scientific session, dedicated to the 80th anniversary of Prof. Dimiter Vakarelov

Gyolechitsa, 12-14 May 2018

This is a joint research initiated by prof. Lars Kristiansen from Oslo University [2, 3] together with prof. Frank Stephan from the National University of Singapore.

This is a joint research initiated by prof. Lars Kristiansen from Oslo University [2, 3] together with prof. Frank Stephan from the National University of Singapore.

It is partially funded by the Bulgarian National Science Fund through the project "Models of computability", DN-02-16/19.12.2016.

There are many different ways to represent a real number ξ :

There are many different ways to represent a real number ξ :

Dedekind cuts: the real number ξ is represented by the set of all rationals q < ξ.</p>

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

There are many different ways to represent a real number ξ :

Dedekind cuts: the real number ξ is represented by the set of all rationals q < ξ.</p>

Cauchy sequences: the real number ξ is represented by a sequence q_n of rationals, which converges to ξ with a pre-specified rate of convergence.

There are many different ways to represent a real number ξ :

- Dedekind cuts: the real number ξ is represented by the set of all rationals q < ξ.</p>
- Cauchy sequences: the real number ξ is represented by a sequence q_n of rationals, which converges to ξ with a pre-specified rate of convergence.
- Base b-expansions: the real number ξ is represented by its sequence of digits in base b ≥ 2.

There are many different ways to represent a real number ξ :

- Dedekind cuts: the real number ξ is represented by the set of all rationals q < ξ.</p>
- Cauchy sequences: the real number ξ is represented by a sequence q_n of rationals, which converges to ξ with a pre-specified rate of convergence.
- Base b-expansions: the real number ξ is represented by its sequence of digits in base b ≥ 2.

Our aim is to compare the complexity of these representations.

There are many different ways to represent a real number ξ :

- Dedekind cuts: the real number ξ is represented by the set of all rationals q < ξ.</p>
- Cauchy sequences: the real number ξ is represented by a sequence q_n of rationals, which converges to ξ with a pre-specified rate of convergence.
- Base b-expansions: the real number ξ is represented by its sequence of digits in base b ≥ 2.

Our aim is to compare the complexity of these representations. Our framework for complexity is subrecursive: roughly speaking, a computation is *subrecursive* if the number of iterations in any cycle can be computed in advance, just before executing the cycle.

There are many different ways to represent a real number ξ :

- Dedekind cuts: the real number ξ is represented by the set of all rationals q < ξ.</p>
- Cauchy sequences: the real number ξ is represented by a sequence q_n of rationals, which converges to ξ with a pre-specified rate of convergence.
- Base b-expansions: the real number ξ is represented by its sequence of digits in base b ≥ 2.

Our aim is to compare the complexity of these representations. Our framework for complexity is subrecursive: roughly speaking, a computation is *subrecursive* if the number of iterations in any cycle can be computed in advance, just before executing the cycle. Thus unbounded search is not allowed in a subrecursive computation.

Representations of real numbers

Let ξ be an irrational number.

Definition

The function $C : \mathbb{N} \to \mathbb{Q}$ is a *Cauchy sequence* for ξ if and only if for all $n \in \mathbb{N}$

$$|C(n)-\xi|<\frac{1}{2^n}.$$

Representations of real numbers

Let ξ be an irrational number.

Definition

The function $C : \mathbb{N} \to \mathbb{Q}$ is a *Cauchy sequence* for ξ if and only if for all $n \in \mathbb{N}$

$$|C(n)-\xi|<\frac{1}{2^n}.$$

The function $D:\mathbb{Q}\to\{0,1\}$ is a *Dedekind cut* of ξ if and only if for all $q\in\mathbb{Q}$

 $D(q) = 0 \Leftrightarrow q < \xi.$

Representations of real numbers

Let ξ be an irrational number.

Definition

The function $C : \mathbb{N} \to \mathbb{Q}$ is a *Cauchy sequence* for ξ if and only if for all $n \in \mathbb{N}$

$$|C(n)-\xi|<\frac{1}{2^n}.$$

The function $D:\mathbb{Q}\to\{0,1\}$ is a *Dedekind cut* of ξ if and only if for all $q\in\mathbb{Q}$

$$D(q) = 0 \Leftrightarrow q < \xi.$$

The function $T : \mathbb{Q} \to \mathbb{Q}$ is a *trace function* for ξ if and only if for all $q \in \mathbb{Q}$

$$|T(q)-\xi|<|q-\xi|.$$

Let ϕ, ψ be total functions in the natural numbers. We say that ϕ is *elementary in* ψ ($\phi \leq_E \psi$) if and only if ϕ can be generated from ψ and the initial functions (projections, constants, successor, $\lambda n.2^n$) using elementary operations (composition and bounded primitive recursion).

Let ϕ, ψ be total functions in the natural numbers. We say that ϕ is *elementary in* ψ ($\phi \leq_E \psi$) if and only if ϕ can be generated from ψ and the initial functions (projections, constants, successor, $\lambda n.2^n$) using elementary operations (composition and bounded primitive recursion).

The function ϕ is *elementary* if and only if $\phi \leq_E 0$.

Let ϕ, ψ be total functions in the natural numbers.

We say that ϕ is elementary in ψ ($\phi \leq_E \psi$) if and only if ϕ can be generated from ψ and the initial functions (projections, constants, successor, $\lambda n.2^n$) using elementary operations (composition and bounded primitive recursion).

The function ϕ is *elementary* if and only if $\phi \leq_E 0$.

We say that ϕ is primitive recursive in ψ ($\phi \leq_{PR} \psi$) if and only if ϕ can be generated from ψ and the initial functions using primitive recursive operations (composition and (unbounded) primitive recursion).

Let ϕ, ψ be total functions in the natural numbers.

We say that ϕ is elementary in ψ ($\phi \leq_E \psi$) if and only if ϕ can be generated from ψ and the initial functions (projections, constants, successor, $\lambda n.2^n$) using elementary operations (composition and bounded primitive recursion).

The function ϕ is *elementary* if and only if $\phi \leq_E 0$.

We say that ϕ is primitive recursive in ψ ($\phi \leq_{PR} \psi$) if and only if ϕ can be generated from ψ and the initial functions using primitive recursive operations (composition and (unbounded) primitive recursion).

The function ϕ is *primitive recursive* if and only if $\phi \leq_{PR} 0$.

Let ϕ, ψ be total functions in the natural numbers.

We say that ϕ is elementary in ψ ($\phi \leq_E \psi$) if and only if ϕ can be generated from ψ and the initial functions (projections, constants, successor, $\lambda n.2^n$) using elementary operations (composition and bounded primitive recursion).

The function ϕ is *elementary* if and only if $\phi \leq_{\mathcal{E}} 0$.

We say that ϕ is primitive recursive in ψ ($\phi \leq_{PR} \psi$) if and only if ϕ can be generated from ψ and the initial functions using primitive recursive operations (composition and (unbounded) primitive recursion).

The function ϕ is *primitive recursive* if and only if $\phi \leq_{PR} 0$. We assume some coding of \mathbb{Z} and \mathbb{Q} into the natural numbers. Under this coding all of the usual basic operations will be elementary. Thus we allow \mathbb{Z} or \mathbb{Q} in place of \mathbb{N} for the arguments and/or the result of the functions ϕ, ψ . A function $h : \mathbb{N} \to \mathbb{N}$ is *honest* if h is monotonically increasing $(h(n) \le h(n+1))$, dominates $\lambda n \cdot 2^n$ $(h(n) \ge 2^n)$ and has elementary graph (the relation f(x) = y is elementary).

A function $h : \mathbb{N} \to \mathbb{N}$ is *honest* if h is monotonically increasing $(h(n) \le h(n+1))$, dominates $\lambda n \cdot 2^n$ $(h(n) \ge 2^n)$ and has elementary graph (the relation f(x) = y is elementary). A *subrecursive class* S is any efficiently enumerable class of computable total functions.

A function $h : \mathbb{N} \to \mathbb{N}$ is *honest* if h is monotonically increasing $(h(n) \le h(n+1))$, dominates $\lambda n.2^n$ $(h(n) \ge 2^n)$ and has elementary graph (the relation f(x) = y is elementary). A *subrecursive class* S is any efficiently enumerable class of computable total functions.

For any subrecursive class S there exists an honest function f, such that $f \notin S$.

(日) (同) (三) (三) (三) (○) (○)

A function $h : \mathbb{N} \to \mathbb{N}$ is *honest* if h is monotonically increasing $(h(n) \le h(n+1))$, dominates $\lambda n \cdot 2^n$ $(h(n) \ge 2^n)$ and has elementary graph (the relation f(x) = y is elementary). A *subrecursive class* S is any efficiently enumerable class of computable total functions.

For any subrecursive class S there exists an honest function f, such that $f \notin S$.

Roughly speaking, the graph of f is easily computable, but f grows too fast to belong ot S.

Proposition

The following are equivalent for an irrational number ξ :

• there exists a computable Cauchy sequence for ξ ;

- the Dedekind cut of ξ is computable;
- there exists a computable trace function for ξ .

Proposition

The following are equivalent for an irrational number ξ :

- there exists a computable Cauchy sequence for ξ ;
- the Dedekind cut of ξ is computable;
- there exists a computable trace function for ξ .

The proof is uniform in ξ , because ξ is assumed irrational.

Proposition

The following are equivalent for an irrational number ξ :

- there exists a computable Cauchy sequence for ξ ;
- the Dedekind cut of ξ is computable;
- there exists a computable trace function for ξ .

The proof is uniform in ξ , because ξ is assumed irrational. Without this assumption the uniformity is lost, but the proposition remains true.

Proposition

The following are equivalent for an irrational number ξ :

- there exists a computable Cauchy sequence for ξ ;
- the Dedekind cut of ξ is computable;
- there exists a computable trace function for ξ .

The proof is uniform in ξ , because ξ is assumed irrational. Without this assumption the uniformity is lost, but the proposition remains true.

From our viewpoint any representation of the rational numbers is considered trivial.

Given a Dedekind cut of the irrational number ξ we can subrecursively compute a Cauchy sequence for ξ .

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Given a Dedekind cut of the irrational number ξ we can subrecursively compute a Cauchy sequence for ξ . In fact, we can compute subrecursively the decimal digits of ξ .

Given a Dedekind cut of the irrational number ξ we can subrecursively compute a Cauchy sequence for ξ . In fact, we can compute subrecursively the decimal digits of ξ . The only problem is with the whole part of ξ : an unbounded search is needed to find $n \in \mathbb{N}$, such that $n < \xi < n + 1$.

Given a Dedekind cut of the irrational number ξ we can subrecursively compute a Cauchy sequence for ξ . In fact, we can compute subrecursively the decimal digits of ξ . The only problem is with the whole part of ξ : an unbounded search is needed to find $n \in \mathbb{N}$, such that $n < \xi < n + 1$. We assume we know this n in advance and use it as a constant in the algorithm.

Given a Dedekind cut of the irrational number ξ we can subrecursively compute a Cauchy sequence for ξ . In fact, we can compute subrecursively the decimal digits of ξ . The only problem is with the whole part of ξ : an unbounded search is needed to find $n \in \mathbb{N}$, such that $n < \xi < n + 1$. We assume we know this n in advance and use it as a constant in the algorithm.

The remaining digits to the right of the decimal point of ξ can be computed subrecursively.

Given a Dedekind cut of the irrational number ξ we can subrecursively compute a Cauchy sequence for ξ . In fact, we can compute subrecursively the decimal digits of ξ . The only problem is with the whole part of ξ : an unbounded search is needed to find $n \in \mathbb{N}$, such that $n < \xi < n + 1$. We assume we know this n in advance and use it as a constant in the algorithm.

The remaining digits to the right of the decimal point of ξ can be computed subrecursively.

Finally, by taking q_n to be the rational number, consisting of the whole part of ξ and its first *n* digits after the decimal point, we obtain a Cauchy sequence for ξ .

In the reverse direction, it is not possible to compute subrecursively the Dedekind cut of an irrational number ξ given a Cauchy sequence for ξ .

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

In the reverse direction, it is not possible to compute subrecursively the Dedekind cut of an irrational number ξ given a Cauchy sequence for ξ .

To decide whether $q < \xi$ given a Cauchy sequence q_n for ξ an unbounded search is needed to produce an interval, containing ξ , which is either to the left or to the right of q.

In the reverse direction, it is not possible to compute subrecursively the Dedekind cut of an irrational number ξ given a Cauchy sequence for ξ .

To decide whether $q < \xi$ given a Cauchy sequence q_n for ξ an unbounded search is needed to produce an interval, containing ξ , which is either to the left or to the right of q.

 q_n-2^{-n} ξ q_n+2^{-n} q

In the reverse direction, it is not possible to compute subrecursively the Dedekind cut of an irrational number ξ given a Cauchy sequence for ξ .

To decide whether $q < \xi$ given a Cauchy sequence q_n for ξ an unbounded search is needed to produce an interval, containing ξ , which is either to the left or to the right of q.

$$q_n - 2^{-n}$$
 ξ $q_n + 2^{-n} q$
 $q_n - 2^{-n} \xi$ $q_n + 2^{-n}$

Dedekind cuts and trace functions

Given a trace function T of an irrational number ξ we can subrecursively compute the Dedekind cut of ξ by

 $T(q) < q \Rightarrow \xi < q,$ $T(q) > q \Rightarrow q < \xi.$

Dedekind cuts and trace functions

Given a trace function T of an irrational number ξ we can subrecursively compute the Dedekind cut of ξ by

$$T(q) < q \Rightarrow \xi < q,$$

 $T(q) > q \Rightarrow q < \xi.$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

But conversely, given the Dedekind cut of ξ is not possible to obtain a trace function T subrecursively.

Dedekind cuts and trace functions

Given a trace function T of an irrational number ξ we can subrecursively compute the Dedekind cut of ξ by

$$T(q) < q \Rightarrow \xi < q,$$

 $T(q) > q \Rightarrow q < \xi.$

But conversely, given the Dedekind cut of ξ is not possible to obtain a trace function T subrecursively. Given $q \in \mathbb{Q}$, an unbounded search is needed to find $T(q) \in \mathbb{Q}$, such that $q < T(q) < \xi$ or $\xi < T(q) < q$.

For a class S of functions, we denote by S_T, S_D, S_C the set of all real numbers, which have a trace function, Dedekind cut or Cauchy sequence in S, respectively.

For a class S of functions, we denote by S_T, S_D, S_C the set of all real numbers, which have a trace function, Dedekind cut or Cauchy sequence in S, respectively.

Theorem (Kristiansen)

For any subrecursive class S, closed under elementary operations we have

 $\mathcal{S}_T \subset \mathcal{S}_D \subset \mathcal{S}_C.$

From now on we consider only irrational numbers $\xi \in (0, 1)$.

From now on we consider only irrational numbers $\xi \in (0, 1)$. For any base $b \ge 2$, there exists a unique sequence $D_1 D_2 \dots D_n \dots$ of *b*-digits, such that

$$0.D_1D_2\ldots D_n < \xi < 0.D_1D_2\ldots D_n + \frac{1}{b^n}$$

Theorem (Mostowski, Kristiansen)

For any subrecursive class S, closed under elementary operations and any two bases a, b we have

 $S_{bE} \subseteq S_{aE} \iff$ every prime factor of a is a prime factor of b.

It follows trivially that for any base *b* there exists base *a*, such that S_{aE} and S_{bE} are not comparable with respect to inclusion.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

It follows trivially that for any base *b* there exists base *a*, such that S_{aE} and S_{bE} are not comparable with respect to inclusion. But from the considerations above we have $S_D \subseteq S_{aE} \subseteq S_C$,

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

It follows trivially that for any base *b* there exists base *a*, such that S_{aE} and S_{bE} are not comparable with respect to inclusion. But from the considerations above we have $S_D \subseteq S_{aE} \subseteq S_C$, therefore

$$\mathcal{S}_T \subset \mathcal{S}_D \subset \mathcal{S}_{bE} \subset \mathcal{S}_C$$

for any subrecursive class S, closed under elementary operations and any base b.

Base-b sum approximations from below

Let us fix some base *b*. Any irrational number $\xi \in (0,1)$ can be written in the form

$$\xi = \frac{d_1}{b^{k_1}} + \frac{d_2}{b^{k_2}} + \frac{d_3}{b^{k_3}} + \dots,$$

where k_n is a strictly increasing sequence of positive integers and d_n are non-zero base-*b* digits, $d_n \in \{1, \ldots, b-1\}$.

Base-b sum approximations from below

Let us fix some base b. Any irrational number $\xi \in (0,1)$ can be written in the form

$$\xi = \frac{d_1}{b^{k_1}} + \frac{d_2}{b^{k_2}} + \frac{d_3}{b^{k_3}} + \dots,$$

where k_n is a strictly increasing sequence of positive integers and d_n are non-zero base-*b* digits, $d_n \in \{1, \ldots, b-1\}$.

Definition

The function \hat{A}_{b}^{ξ} , defined by $\hat{A}_{b}^{\xi}(n) = d_{n}b^{-k_{n}}$ for n > 0 and $\hat{A}_{b}^{\xi}(0) = 0$ is called *base-b sum approximation from below* of the number ξ .

Base-*b* sum approximations from below

Let us fix some base b. Any irrational number $\xi \in (0,1)$ can be written in the form

$$\xi = \frac{d_1}{b^{k_1}} + \frac{d_2}{b^{k_2}} + \frac{d_3}{b^{k_3}} + \dots,$$

where k_n is a strictly increasing sequence of positive integers and d_n are non-zero base-*b* digits, $d_n \in \{1, \ldots, b-1\}$.

Definition

The function \hat{A}_{b}^{ξ} , defined by $\hat{A}_{b}^{\xi}(n) = d_{n}b^{-k_{n}}$ for n > 0 and $\hat{A}_{b}^{\xi}(0) = 0$ is called *base-b sum approximation from below* of the number ξ .

For a class of functions S we denote by $S_{b\uparrow}$ the set of all real numbers, which have a base-*b* sum approximation from below in S, that is

$$\xi \in \mathcal{S}_{b\uparrow} \iff \hat{A}_b^{\xi} \in \mathcal{S}.$$

Base-b sum approximations from above

Moreover, we can write

$$\xi = 1 - \frac{d_1'}{b^{m_1}} - \frac{d_2'}{b^{m_2}} - \frac{d_3'}{b^{m_3}} - \dots,$$

where m_n is a strictly increasing sequence of positive integers and d'_n are non-zero base-*b* digits.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Numbers with interesting properties

Let P_n denote the *n*-th prime ($P_0 = 2, P_1 = 3, ...$). For any honest function f we define the rational number α_n^f and the irrational number α^f by

$$\alpha_n^f = \sum_{i=0}^n P_i^{-f(i)}, \ \alpha^f = \lim_{n \to \infty} \alpha_n^f.$$

In fact, f is not arbitrary, it must satisfy a certain growth property, but the definition is easily modified to work in all cases.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Let P_n denote the *n*-th prime ($P_0 = 2, P_1 = 3,...$). For any honest function f we define the rational number α_n^f and the irrational number α^f by

$$\alpha_n^f = \sum_{i=0}^n P_i^{-f(i)}, \ \alpha^f = \lim_{n \to \infty} \alpha_n^f.$$

In fact, f is not arbitrary, it must satisfy a certain growth property, but the definition is easily modified to work in all cases.

Theorem (Georgiev, Kristiansen, Stephan)

For any honest function f and any base b the function $\hat{A}_{b}^{\alpha^{t}}$ is elementary.

Let P_n denote the *n*-th prime ($P_0 = 2, P_1 = 3,...$). For any honest function f we define the rational number α_n^f and the irrational number α^f by

$$\alpha_n^f = \sum_{i=0}^n P_i^{-f(i)}, \ \alpha^f = \lim_{n \to \infty} \alpha_n^f.$$

In fact, f is not arbitrary, it must satisfy a certain growth property, but the definition is easily modified to work in all cases.

Theorem (Georgiev, Kristiansen, Stephan)

For any honest function f and any base b the function $\hat{A}_{b}^{\alpha^{t}}$ is elementary.

Theorem (Georgiev, Kristiansen, Stephan) For any honest function f we have $f \leq_{PR} \hat{G}$, where \hat{G} is the general sum approximation from below of α^{f} .

Thus we have

$$\mathcal{S}_{g\uparrow}\subset igcap_{b=2}^\infty \mathcal{S}_{b\uparrow}$$

00

and a symmetric argument gives

$$\mathcal{S}_{g\downarrow}\subset igcap_{b=2}^\infty \mathcal{S}_{b\downarrow}$$

for any subrecursive class $\ensuremath{\mathcal{S}}$, closed under primitive recursive operations.

Thus we have

$$\mathcal{S}_{g\uparrow}\subset igcap_{b=2}^\infty \mathcal{S}_{b\uparrow}$$

0

and a symmetric argument gives

$$\mathcal{S}_{g\downarrow}\subset igcap_{b=2}^\infty \mathcal{S}_{b\downarrow}$$

for any subrecursive class $\ensuremath{\mathcal{S}}$, closed under primitive recursive operations.

Theorem (Georgiev, Kristiansen, Stephan)

For any honest function f there exists an elementary function $\check{T}:\mathbb{Q}\to\mathbb{Q},$ such that

$$\check{T}(q) = 0 \text{ if } q < \alpha^{f}, \ q > \check{T}(q) > \alpha^{f} \text{ if } q > \alpha^{f}.$$

Thus we have

$$\mathcal{S}_{g\uparrow}\subset igcap_{b=2}^\infty \mathcal{S}_{b\uparrow}$$

~

and a symmetric argument gives

$$\mathcal{S}_{g\downarrow}\subset igcap_{b=2}^\infty \mathcal{S}_{b\downarrow}$$

for any subrecursive class $\ensuremath{\mathcal{S}}$, closed under primitive recursive operations.

Theorem (Georgiev, Kristiansen, Stephan)

For any honest function f there exists an elementary function $\check{T}:\mathbb{Q}\to\mathbb{Q},$ such that

$$\check{T}(q) = 0 ext{ if } q < lpha^f, ext{ } q > \check{T}(q) > lpha^f ext{ if } q > lpha^f.$$

It follows that α_f has an elementary trace function from above, as well as elementary Dedekind cut.

Let $\ensuremath{\mathcal{S}}$ be any subrecursive class, closed under primitive recursive operations.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Let $\ensuremath{\mathcal{S}}$ be any subrecursive class, closed under primitive recursive operations.

Let us choose an honest function f, such that $f \notin S$.

Let $\ensuremath{\mathcal{S}}$ be any subrecursive class, closed under primitive recursive operations.

Let us choose an honest function f, such that $f \notin S$.

Using the above results it follows that $\alpha^f \in S_{T\downarrow} \cap S_D = S_{g\downarrow}$.

Let $\ensuremath{\mathcal{S}}$ be any subrecursive class, closed under primitive recursive operations.

Let us choose an honest function f, such that $f \notin S$. Using the above results it follows that $\alpha^f \in S_{T\downarrow} \cap S_D = S_{g\downarrow}$. On the other hand, $\hat{G} \notin S$, because $f \notin S$.

Let $\ensuremath{\mathcal{S}}$ be any subrecursive class, closed under primitive recursive operations.

Let us choose an honest function f, such that $f \notin S$. Using the above results it follows that $\alpha^f \in S_{T\downarrow} \cap S_D = S_{g\downarrow}$. On the other hand, $\hat{G} \notin S$, because $f \notin S$. Thus we obtain $S_{g\downarrow} \notin S_{g\uparrow}$.

Let $\ensuremath{\mathcal{S}}$ be any subrecursive class, closed under primitive recursive operations.

Let us choose an honest function f, such that $f \notin S$. Using the above results it follows that $\alpha^f \in S_{T\downarrow} \cap S_D = S_{g\downarrow}$. On the other hand, $\hat{G} \notin S$, because $f \notin S$. Thus we obtain $S_{g\downarrow} \nsubseteq S_{g\uparrow}$. A symmetric argument yields $S_{g\uparrow} \nsubseteq S_{g\downarrow}$.
