This talk is about relative computability of real numbers and real functions.

(ロ)、(型)、(E)、(E)、 E) の(の)

This talk is about relative computability of real numbers and real functions. Our aim is to study the complexity of integration.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

This talk is about relative computability of real numbers and real functions. Our aim is to study the complexity of integration. The motivating question is:

Given a real function  $\theta : [a, b] \to \mathbb{R}$  and real numbers a, b, which are efficiently computable, is it true that the real number

$$\int_{a}^{b} \theta(x) dx$$

is also efficiently computable?

This talk is about relative computability of real numbers and real functions. Our aim is to study the complexity of integration. The motivating question is:

Given a real function  $\theta : [a, b] \to \mathbb{R}$  and real numbers a, b, which are efficiently computable, is it true that the real number

$$\int_{a}^{b} \theta(x) dx$$

is also efficiently computable?

Our framework for complexity is subrecursive, that is we are interested in inductively defined classes of total functions in  $\mathbb{N}$ , contained in the low levels of Grzegorczyk's hierarchy.

We denote  $\mathcal{T}_m = \{a | a : \mathbb{N}^m \to \mathbb{N}\}$  and  $\mathcal{T} = \bigcup_m \mathcal{T}_m$ .

・ロト・日本・モト・モート ヨー うへで

We denote  $\mathcal{T}_m = \{a | a : \mathbb{N}^m \to \mathbb{N}\}$  and  $\mathcal{T} = \bigcup_m \mathcal{T}_m$ . The functions  $\lambda x_1 \dots x_n \cdot x_m (1 \le m \le n), \ \lambda x \cdot x + 1, \ \lambda xy \cdot x - y, \ \lambda xy \cdot xy$ , belonging to  $\mathcal{T}$ , will be called the initial functions.

We denote  $\mathcal{T}_m = \{a | a : \mathbb{N}^m \to \mathbb{N}\}$  and  $\mathcal{T} = \bigcup_m \mathcal{T}_m$ . The functions  $\lambda x_1 \dots x_n \cdot x_m (1 \le m \le n)$ ,  $\lambda x \cdot x + 1$ ,  $\lambda xy \cdot x - y$ ,  $\lambda xy \cdot xy$ , belonging to  $\mathcal{T}$ , will be called the initial functions.

#### Definition

The class  $\mathcal{M}^2$  is the smallest subclass of  $\mathcal{T}$ , which contains the initial functions and is closed under substitution and bounded minimization  $(f \mapsto \lambda \vec{x} y.\mu_{z \leq y}[f(\vec{x}, z) = 0]).$ 

We denote  $\mathcal{T}_m = \{a | a : \mathbb{N}^m \to \mathbb{N}\}$  and  $\mathcal{T} = \bigcup_m \mathcal{T}_m$ . The functions  $\lambda x_1 \dots x_n \cdot x_m (1 \le m \le n)$ ,  $\lambda x \cdot x + 1$ ,  $\lambda xy \cdot x - y$ ,  $\lambda xy \cdot xy$ , belonging to  $\mathcal{T}$ , will be called the initial functions.

#### Definition

The class  $\mathcal{M}^2$  is the smallest subclass of  $\mathcal{T}$ , which contains the initial functions and is closed under substitution and bounded minimization  $(f \mapsto \lambda \vec{x} y.\mu_{z \leq y}[f(\vec{x}, z) = 0]).$ 

The class  $\mathcal{L}^2$  has the same definition as  $\mathcal{M}^2$ , but bounded minimization is replaced by bounded summation.

We denote  $\mathcal{T}_m = \{a | a : \mathbb{N}^m \to \mathbb{N}\}$  and  $\mathcal{T} = \bigcup_m \mathcal{T}_m$ . The functions  $\lambda x_1 \dots x_n . x_m (1 \le m \le n)$ ,  $\lambda x . x + 1$ ,  $\lambda xy . x \div y$ ,  $\lambda xy . xy$ , belonging to  $\mathcal{T}$ , will be called the initial functions.

#### Definition

The class  $\mathcal{M}^2$  is the smallest subclass of  $\mathcal{T}$ , which contains the initial functions and is closed under substitution and bounded minimization  $(f \mapsto \lambda \vec{x} y.\mu_{z \leq y}[f(\vec{x}, z) = 0]).$ 

The class  $\mathcal{L}^2$  has the same definition as  $\mathcal{M}^2$ , but bounded minimization is replaced by bounded summation.

The same for the class  $\mathcal{E}^2$ , where bounded minimization is replaced by limited primitive recursion.

We denote  $\mathcal{T}_m = \{a | a : \mathbb{N}^m \to \mathbb{N}\}$  and  $\mathcal{T} = \bigcup_m \mathcal{T}_m$ . The functions  $\lambda x_1 \dots x_n \cdot x_m (1 \le m \le n)$ ,  $\lambda x \cdot x + 1$ ,  $\lambda xy \cdot x - y$ ,  $\lambda xy \cdot xy$ , belonging to  $\mathcal{T}$ , will be called the initial functions.

#### Definition

The class  $\mathcal{M}^2$  is the smallest subclass of  $\mathcal{T}$ , which contains the initial functions and is closed under substitution and bounded minimization  $(f \mapsto \lambda \vec{x} y.\mu_{z \leq y}[f(\vec{x}, z) = 0]).$ 

The class  $\mathcal{L}^2$  has the same definition as  $\mathcal{M}^2$ , but bounded minimization is replaced by bounded summation.

The same for the class  $\mathcal{E}^2$ , where bounded minimization is replaced by limited primitive recursion.

We have  $\mathcal{M}^2 \subseteq \mathcal{L}^2 \subseteq \mathcal{E}^2$  and whether each of these inclusions is proper is an open question.

## Log-bounded sums

The classes  $\mathcal{L}^2$  and  $\mathcal{E}^2$  are closed under bounded summation, but it is not known whether the same is true for  $\mathcal{M}^2$ .

## Log-bounded sums

The classes  $\mathcal{L}^2$  and  $\mathcal{E}^2$  are closed under bounded summation, but it is not known whether the same is true for  $\mathcal{M}^2$ . Nevertheless, we have the following:

## Theorem ([1])

For any  $k, m \in \mathbb{N}$  and any function  $f \in \mathcal{T}_{m+1} \cap \mathcal{M}^2$ , the function  $g \in \mathcal{T}_{m+1}$  defined by

$$g(\vec{x}, y) = \sum_{z \leq \log_2^k(y+1)} f(\vec{x}, z)$$

also belongs to  $\mathcal{M}^2$ .

## Definition

The triple of functions  $(f, g, h) \in \mathcal{T}_1^3$  is a name of the real number  $\xi$  iff for all  $n \in \mathbb{N}$ ,

$$\left|\frac{f(n)-g(n)}{h(n)+1}-\xi\right|<\frac{1}{n+1}.$$

5. For all m, n, k, if  $F_0$  is an (n, m + 1)-operator which belongs to **logRO**, then so is the operator F defined by

$$F(\vec{f})(\vec{x}, y) = \sum_{z \le \log_2^k(y+1)} [F_0(\vec{f})(\vec{x}, z) = 0].$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

## Log-rudimentary operators

The definition of the class **logRO** of log-rudimentary operators contains the same clauses as the definition for **RO** and also the following clause:

5. For all m, n, k, if  $F_0$  is an (n, m + 1)-operator which belongs to **logRO**, then so is the operator F defined by

$$F(\vec{f})(\vec{x},y) = \sum_{z \le \log_2^k(y+1)} [F_0(\vec{f})(\vec{x},z) = 0].$$

If there is a uniform definition of log-bounded summation for the class  $\mathcal{M}^2$ , then the same definition, easily modified for operators, will show that  $\mathbf{RO} = \mathbf{logRO}$ .

Definition

The class MSO of  $\mathcal{M}^2\text{-substitutional operators is the smallest class of operators, such that:$ 

(ロ)、(型)、(E)、(E)、 E) のQの

#### Definition

The class MSO of  $\mathcal{M}^2\text{-substitutional operators is the smallest class of operators, such that:$ 

1. For all m, n, i with  $1 \le i \le m$ , the (n, m)-operator F defined by  $F(\vec{f})(\vec{x}) = x_i$  belongs to **MSO**.

#### Definition

The class MSO of  $\mathcal{M}^2\text{-substitutional operators is the smallest class of operators, such that:$ 

- 1. For all m, n, i with  $1 \le i \le m$ , the (n, m)-operator F defined by  $F(\vec{f})(\vec{x}) = x_i$  belongs to **MSO**.
- For any m, n and k ∈ {1,..., n}, if F<sub>0</sub> is an (n, m)-operator which belongs to MSO, then the (n, m)-operator F defined by F(f)(x) = f<sub>k</sub>(F<sub>0</sub>(f)(x))

also belongs to **MSO**.

#### Definition

The class MSO of  $\mathcal{M}^2\text{-substitutional operators is the smallest class of operators, such that:$ 

- 1. For all m, n, i with  $1 \le i \le m$ , the (n, m)-operator F defined by  $F(\vec{f})(\vec{x}) = x_i$  belongs to **MSO**.
- For any m, n and k ∈ {1,..., n}, if F<sub>0</sub> is an (n, m)-operator which belongs to MSO, then the (n, m)-operator F defined by F(f)(x) = f<sub>k</sub>(F<sub>0</sub>(f)(x))

also belongs to MSO.

3. For any m, n, k and  $a \in \mathcal{T}_k \cap \mathcal{M}^2$ , if  $F_1, \ldots, F_k$  are (n, m)-operators which belong to **MSO**, then so is the operator F defined by

$$F(\vec{f})(\vec{x}) = a(F_1(\vec{f})(\vec{x}), \dots, F_k(\vec{f})(\vec{x})).$$

## Some general results

It is easy to see that **MSO** is a proper subclass of **RO**.

## Some general results

It is easy to see that **MSO** is a proper subclass of **RO**. All elementary functions of calculus, restricted to compact subsets of their domains, are uniformly **MSO**-computable.

It is easy to see that **MSO** is a proper subclass of **RO**. All elementary functions of calculus, restricted to compact subsets of their domains, are uniformly **MSO**-computable. The reason is that any real function, which is uniformly **MSO**-computable is bounded by a polynomial. This rules out the reciprocal function, the logarithmic function and the exponential function. The pairs ( $\mathcal{M}^2$ , **MSO**), ( $\mathcal{M}^2$ , **RO**) and ( $\mathcal{M}^2$ , **LogRO**) are

The pairs  $(\mathcal{M}^2, \mathbf{MSO})$ ,  $(\mathcal{M}^2, \mathbf{RO})$  and  $(\mathcal{M}^2, \mathbf{LogRO})$  ar acceptable in the sense of [2].

It is easy to see that **MSO** is a proper subclass of **RO**.

All elementary functions of calculus, restricted to compact subsets of their domains, are uniformly **MSO**-computable.

The reason is that any real function, which is uniformly

**MSO**-computable is bounded by a polynomial.

This rules out the reciprocal function, the logarithmic function and the exponential function.

The pairs  $(\mathcal{M}^2, \mathbf{MSO})$ ,  $(\mathcal{M}^2, \mathbf{RO})$  and  $(\mathcal{M}^2, \mathbf{LogRO})$  are acceptable in the sense of [2]. Therefore, by the characterization theorem of Skordev in [2], the following three conditions are equivalent for a real function  $\theta$ :

- $\theta$  is uniformly **MSO**-computable;
- $\theta$  is uniformly **RO**-computable;
- $\theta$  is uniformly **LogRO**-computable.

Theorem

Let a, b be  $\mathcal{M}^2$ -computable real numbers and  $\theta : [a, b] \to \mathbb{R}$  be uniformly **MSO**-computable and analytic real function. Then the definite integral  $\int_a^b \theta(x) dx$  is an  $\mathcal{M}^2$ -computable real number.

#### Theorem

Let a, b be  $\mathcal{M}^2$ -computable real numbers and  $\theta : [a, b] \to \mathbb{R}$  be uniformly **MSO**-computable and analytic real function. Then the definite integral  $\int_a^b \theta(x) dx$  is an  $\mathcal{M}^2$ -computable real number. Because we can use only log-bounded sums, we need an exponentially convergent quadrature method.

#### Theorem

Let a, b be  $\mathcal{M}^2$ -computable real numbers and  $\theta : [a, b] \to \mathbb{R}$  be uniformly **MSO**-computable and analytic real function. Then the definite integral  $\int_a^b \theta(x) dx$  is an  $\mathcal{M}^2$ -computable real number. Because we can use only log-bounded sums, we need an exponentially convergent quadrature method. By a linear change of variables we may assume [a, b] = [-1, 1].

#### Theorem

#### Theorem

Let a, b be  $\mathcal{M}^2$ -computable real numbers and  $\theta : [a, b] \times D \to \mathbb{R}$ be uniformly **MSO**-computable. Let there exist a real constant A > 0, such that for any fixed  $y \in D$ ,  $\theta$  has an analytic continuation defined in  $[a, b] \times [-A, A] \subseteq \mathbb{C}$ .

#### Theorem

Let a, b be  $\mathcal{M}^2$ -computable real numbers and  $\theta : [a, b] \times D \to \mathbb{R}$ be uniformly **MSO**-computable. Let there exist a real constant A > 0, such that for any fixed  $y \in D$ ,  $\theta$  has an analytic continuation defined in  $[a, b] \times [-A, A] \subseteq \mathbb{C}$ . Let there also exist a polynomial P, such that  $|\theta(x \pm Bi, y)| \leq P(|y|)$  for all  $y \in D, x \in [a, b], B \leq A$ .

#### Theorem

Let a, b be  $\mathcal{M}^2$ -computable real numbers and  $\theta : [a, b] \times D \to \mathbb{R}$ be uniformly **MSO**-computable. Let there exist a real constant A > 0, such that for any fixed  $y \in D$ ,  $\theta$  has an analytic continuation defined in  $[a, b] \times [-A, A] \subseteq \mathbb{C}$ . Let there also exist a polynomial P, such that  $|\theta(x \pm Bi, y)| \leq P(|y|)$  for all  $y \in D, x \in [a, b], B \leq A$ . Then the real function  $I : D \to \mathbb{R}$ , defined by

$$I(y) = \int_{a}^{b} \theta(x, y) dx$$

is uniformly MSO-computable.

#### Theorem

Let a, b be  $\mathcal{M}^2$ -computable real numbers and  $\theta : [a, b] \times D \to \mathbb{R}$ be uniformly **MSO**-computable. Let there exist a real constant A > 0, such that for any fixed  $y \in D$ ,  $\theta$  has an analytic continuation defined in  $[a, b] \times [-A, A] \subseteq \mathbb{C}$ . Let there also exist a polynomial P, such that  $|\theta(x \pm Bi, y)| \leq P(|y|)$  for all  $y \in D, x \in [a, b], B \leq A$ . Then the real function  $I : D \to \mathbb{R}$ , defined by

$$I(y) = \int_a^b \theta(x, y) dx$$

is uniformly **MSO**-computable.

The proof follows the same argument. The important thing to show is that the log-bounded sum of a uniformly **MSO**-computable real function is again uniformly **MSO**-computable. This requires the use of log-rudimentary operators.

Theorem

Let a be an  $\mathcal{M}^2$ -computable real number. Let  $\theta : [a, +\infty) \to \mathbb{R}$  be uniformly **MSO**-computable real function, which has an analytic continuation defined in the half-plane  $Re(z) \ge a$ .

Theorem

Let a be an  $\mathcal{M}^2$ -computable real number. Let  $\theta : [a, +\infty) \to \mathbb{R}$  be uniformly **MSO**-computable real function, which has an analytic continuation defined in the half-plane  $Re(z) \ge a$ . Let there exist a real constant A > 0 and a polynomial P, such that  $|\theta(x + yi)| \le P(|\xi|)$  for all  $\xi \ge a, x \in [a, \xi], |y| \le A(\xi - a)$ .

#### Theorem

Let a be an  $\mathcal{M}^2$ -computable real number. Let  $\theta : [a, +\infty) \to \mathbb{R}$  be uniformly **MSO**-computable real function, which has an analytic continuation defined in the half-plane  $\operatorname{Re}(z) \ge a$ . Let there exist a real constant A > 0 and a polynomial P, such that  $|\theta(x + yi)| \le P(|\xi|)$  for all  $\xi \ge a, x \in [a, \xi], |y| \le A(\xi - a)$ . Then the real function  $I : [a, +\infty) \to \mathbb{R}$ , defined by

$$I(\xi) = \int_a^{\xi} \theta(x) dx$$

is uniformly MSO-computable.

#### Theorem

Let a be an  $\mathcal{M}^2$ -computable real number. Let  $\theta : [a, +\infty) \to \mathbb{R}$  be uniformly **MSO**-computable real function, which has an analytic continuation defined in the half-plane  $Re(z) \ge a$ . Let there exist a real constant A > 0 and a polynomial P, such that  $|\theta(x + yi)| \le P(|\xi|)$  for all  $\xi \ge a, x \in [a, \xi], |y| \le A(\xi - a)$ . Then the real function  $I : [a, +\infty) \to \mathbb{R}$ , defined by

$$I(\xi) = \int_a^{\xi} \theta(x) dx$$

is uniformly MSO-computable.

By the linear change  $x = \frac{\xi - a}{2}t + \frac{\xi + a}{2}$  we have

$$I(\xi) = \int_a^{\xi} \theta(x) dx = \frac{\xi - a}{2} \int_{-1}^1 \theta\left(\frac{\xi - a}{2}t + \frac{\xi + a}{2}\right) dt$$

and we can apply the second theorem.

## Euler-Mascheroni constant

Theorem Euler's constant  $\gamma$  is  $\mathcal{M}^2$ -computable.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

## Euler-Mascheroni constant

Theorem Euler's constant  $\gamma$  is  $\mathcal{M}^2$ -computable. We use the following representation

$$\gamma = -\int_0^\infty e^{-x} \ln x \ dx.$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

## Euler-Mascheroni constant

Theorem Euler's constant  $\gamma$  is  $\mathcal{M}^2$ -computable. We use the following representation

$$\gamma = -\int_0^\infty e^{-x} \ln x \ dx.$$

This integral is the sum of the following two integrals:

$$I_1 = \int_1^\infty e^{-x} \ln x \ dx,$$

$$I_2 = \int_0^1 e^{-x} \ln x \ dx = \int_1^\infty e^{-\frac{1}{t}} \ln t \frac{1}{t^2} \ dt,$$

which are easily seen to be  $\mathcal{M}^2\text{-}\mathsf{computable}$  by using the third theorem.

# Euler-Mascheroni constant (continued)

In fact, by a careful estimation of the error of approximation, we can extract an actual sequence, which converges to  $\gamma$  with subexponential rate.
