I present a review of my PhD dissertation. It is in the field of computable analysis. The main question is: What happens if we restrict the generality of computable

processes?

The restriction to the popular classes P, NP, EXP and others is well-studied.

I present a review of my PhD dissertation. It is in the field of computable analysis. The main question is: What happens if we restrict the generality of computable processes?

The restriction to the popular classes P, NP, EXP and others is well-studied. But this is not the case with subrecursive hierarchies.

I present a review of my PhD dissertation. It is in the field of computable analysis. The main question is:

What happens if we restrict the generality of computable processes?

The restriction to the popular classes P, NP, EXP and others is well-studied. But this is not the case with subrecursive hierarchies. The aim of the dissertation is to study computable analysis in the framework of the most popular subrecursive hierarchy -Grzegorczyk's hierarchy of primitive recursive functions.

We remind informally the definition of Grzegorczyk's hierarchy.

We remind informally the definition of Grzegorczyk's hierarchy. It is a strictly increasing sequence

$$\mathcal{E}^0 \subset \mathcal{E}^1 \subset \mathcal{E}^2 \subset \mathcal{E}^3 \subset \dots$$

of sets of functions, whose union is the set of all primitive recursive functions.

We remind informally the definition of Grzegorczyk's hierarchy. It is a strictly increasing sequence

$$\mathcal{E}^0 \subset \mathcal{E}^1 \subset \mathcal{E}^2 \subset \mathcal{E}^3 \subset \dots$$

of sets of functions, whose union is the set of all primitive recursive functions. Each class  $\mathcal{E}^n$  is closed under substitution and limited primitive recursion.

We remind informally the definition of Grzegorczyk's hierarchy. It is a strictly increasing sequence

$$\mathcal{E}^0 \subset \mathcal{E}^1 \subset \mathcal{E}^2 \subset \mathcal{E}^3 \subset \dots$$

of sets of functions, whose union is the set of all primitive recursive functions. Each class  $\mathcal{E}^n$  is closed under substitution and limited primitive recursion.

We also consider two other classes  $\mathcal{M}^2$  and  $\mathcal{L}^2$ .

We remind informally the definition of Grzegorczyk's hierarchy. It is a strictly increasing sequence

$$\mathcal{E}^0 \subset \mathcal{E}^1 \subset \mathcal{E}^2 \subset \mathcal{E}^3 \subset \dots \dots$$

of sets of functions, whose union is the set of all primitive recursive functions. Each class  $\mathcal{E}^n$  is closed under substitution and limited primitive recursion.

We also consider two other classes  $\mathcal{M}^2$  and  $\mathcal{L}^2$ .

The class  $\mathcal{M}^2$  has the same definition as  $\mathcal{E}^2$ , but limited primitive recursion is replaced by bounded minimization. It turns out that it coincides with the set of all functions which are bounded by polynomial and have  $\Delta_0$ -definable graph.

The class  $\mathcal{L}^2$  has the same definition as  $\mathcal{E}^2$ , but limited primitive recursion is replaced by bounded summation.

We have  $\mathcal{M}^2 \subseteq \mathcal{L}^2 \subseteq \mathcal{E}^2$  and whether each of these inclusions is proper is an open question.

The triple of functions  $\langle f, g, h \rangle$  of type  $\mathbb{N} \to \mathbb{N}$  is a *name* of the real number  $\xi$  iff for all  $n \in \mathbb{N}$ ,

$$\left|\frac{f(n)-g(n)}{h(n)+1}-\xi\right|<\frac{1}{n+1}.$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Later Skordev found a general method for proving  $\mathcal{F}$ -computability, where  $\mathcal{F}$  can be  $\mathcal{L}^2$  or any  $\mathcal{E}^n$  for  $n \geq 2$ .

#### Definition

A function  $a : \mathbb{N} \to \mathbb{R}$  is  $\mathcal{F}$ -computable iff there exist binary functions  $f, g, h \in \mathcal{F}$ , such that for any natural s, the triple  $\langle \lambda n.f(s, n), \lambda n.g(n, s), \lambda n.h(n, s) \rangle$  names the real number a(s).

Skordev proved that  $e, \pi$ , the Liouville number L and Euler's constant  $\gamma$  are  $\mathcal{E}^2$ -computable. By using some strong results about  $\Delta_0$ -definable functions, Weiermann refined the proofs to show that e and L are  $\mathcal{M}^2$ -computable.

Later Skordev found a general method for proving  $\mathcal{F}$ -computability, where  $\mathcal{F}$  can be  $\mathcal{L}^2$  or any  $\mathcal{E}^n$  for  $n \geq 2$ .

#### Definition

A function  $a : \mathbb{N} \to \mathbb{R}$  is  $\mathcal{F}$ -computable iff there exist binary functions  $f, g, h \in \mathcal{F}$ , such that for any natural s, the triple  $\langle \lambda n.f(s, n), \lambda n.g(n, s), \lambda n.h(n, s) \rangle$  names the real number a(s).

#### Theorem

Let  $a : \mathbb{N} \to \mathbb{R}$  be an  $\mathcal{F}$ -computable function, such that the series  $\sum_{s=0}^{\infty} a_s$  is convergent and let  $\alpha$  be its sum. Let there exist a function  $p : \mathbb{N} \to \mathbb{N}$  from the class  $\mathcal{F}$ , such that  $\left|\sum_{s \ge y+1} a_s\right| \le \frac{1}{n+1}$  for any natural n and y = p(n). Then the number  $\alpha$  is  $\mathcal{F}$ -computable.

This method is not suitable for the class  $\mathcal{M}^2$ , because it is not known whether this class is closed under bounded summation (that would be the case if and only if  $\mathcal{M}^2 = \mathcal{L}^2$ ). In my master thesis I modify the method above and prove the following

#### Theorem

Let  $a : \mathbb{N} \to \mathbb{R}$  be an  $\mathcal{M}^2$ -computable function, such that the series  $\sum_{s=0}^{\infty} a_s$  is convergent and let  $\alpha$  be its sum. Let there exist a function  $p : \mathbb{N} \to \mathbb{N}$  belonging to  $\mathcal{M}^2$ , such that  $\left|\sum_{s>\log_2(y+1)} a_s\right| \leq \frac{1}{n+1}$  for all natural n and y = p(n). Then the number  $\alpha$  is  $\mathcal{M}^2$ -computable.

This method is not suitable for the class  $\mathcal{M}^2$ , because it is not known whether this class is closed under bounded summation (that would be the case if and only if  $\mathcal{M}^2 = \mathcal{L}^2$ ). In my master thesis I modify the method above and prove the following

#### Theorem

Let  $a : \mathbb{N} \to \mathbb{R}$  be an  $\mathcal{M}^2$ -computable function, such that the series  $\sum_{s=0}^{\infty} a_s$  is convergent and let  $\alpha$  be its sum. Let there exist a function  $p : \mathbb{N} \to \mathbb{N}$  belonging to  $\mathcal{M}^2$ , such that  $\left|\sum_{s>\log_2(y+1)} a_s\right| \leq \frac{1}{n+1}$  for all natural n and y = p(n). Then the number  $\alpha$  is  $\mathcal{M}^2$ -computable.

Using these two methods I proved  $\mathcal{L}^2$ -computability and  $\mathcal{M}^2$ -computability of a large number of constants. Among them is the number  $\pi$ , which is  $\mathcal{M}^2$ -computable and Euler's constant  $\gamma$ , which is  $\mathcal{L}^2$ -computable.

In my master thesis I also consider the representation of real numbers by continued fractions.

In my master thesis I also consider the representation of real numbers by continued fractions.

Every positive irrational real number  $\xi$  has an expansion as a simple continued fraction:

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

In my master thesis I also consider the representation of real numbers by continued fractions.

Every positive irrational real number  $\xi$  has an expansion as a simple continued fraction:

$$\xi = a_0 + rac{1}{a_1 + rac{1}{a_2 + rac{1}{\cdot}}},$$

where  $a_0 = \lfloor \xi \rfloor$  is the integer part of  $\xi$  and for  $i \ge 1$ ,  $a_i$  is a non-zero natural number.

In my master thesis I also consider the representation of real numbers by continued fractions.

Every positive irrational real number  $\xi$  has an expansion as a simple continued fraction:

$$\xi = a_0 + rac{1}{a_1 + rac{1}{a_2 + rac{1}{\cdot}}},$$

where  $a_0 = \lfloor \xi \rfloor$  is the integer part of  $\xi$  and for  $i \ge 1$ ,  $a_i$  is a non-zero natural number. Conversely, every sequence *a* of natural numbers, sucht that  $a_i \ne 0$  for  $i \ge 1$  produces a unique real number.

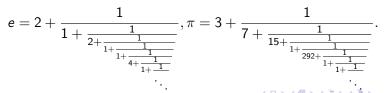

In my master thesis I also consider the representation of real numbers by continued fractions.

Every positive irrational real number  $\xi$  has an expansion as a simple continued fraction:

$$\xi = a_0 + rac{1}{a_1 + rac{1}{a_2 + rac{1}{a_2}}},$$

where  $a_0 = \lfloor \xi \rfloor$  is the integer part of  $\xi$  and for  $i \ge 1$ ,  $a_i$  is a non-zero natural number. Conversely, every sequence a of natural numbers, sucht that  $a_i \ne 0$  for  $i \ge 1$  produces a unique real number.

#### Theorem

For  $n \ge 2$ , if  $\xi$  has continued fraction in  $\mathcal{E}^n$ , then  $\xi$  is  $\mathcal{E}^n$ -computable.

To prove that I strengtened the theorem to the following

Theorem

For  $n \ge 2$ , if the graph  $\{(k, a_k) | k \in \mathbb{N}\}$  of the continued fraction of  $\xi$  is an  $\mathcal{E}^n$ -relation, then  $\xi$  is  $\mathcal{E}^n$ -computable.

To prove that I strengtened the theorem to the following

#### Theorem

For  $n \ge 2$ , if the graph  $\{(k, a_k) | k \in \mathbb{N}\}$  of the continued fraction of  $\xi$  is an  $\mathcal{E}^n$ -relation, then  $\xi$  is  $\mathcal{E}^n$ -computable.

We apply that theorem for

$$\xi_{\mathcal{A}} = \mathcal{A}(0,0) + rac{1}{\mathcal{A}(1,1) + rac{1}{\mathcal{A}(2,2) + rac{1}{-1}}},$$

where A is Ackermann's function.

To prove that I strengtened the theorem to the following

#### Theorem

For  $n \ge 2$ , if the graph  $\{(k, a_k) | k \in \mathbb{N}\}$  of the continued fraction of  $\xi$  is an  $\mathcal{E}^n$ -relation, then  $\xi$  is  $\mathcal{E}^n$ -computable.

We apply that theorem for

$$\xi_{\mathcal{A}} = \mathcal{A}(0,0) + rac{1}{\mathcal{A}(1,1) + rac{1}{\mathcal{A}(2,2) + rac{1}{\cdot}}},$$

where A is Ackermann's function.

It is well-known that  $\lambda x.A(x,x)$  is not primitive recursive and it is also true that its graph is  $\Delta_0$ -definable hence an  $\mathcal{E}^0$ -relation.

To prove that I strengtened the theorem to the following

#### Theorem

For  $n \ge 2$ , if the graph  $\{(k, a_k) | k \in \mathbb{N}\}$  of the continued fraction of  $\xi$  is an  $\mathcal{E}^n$ -relation, then  $\xi$  is  $\mathcal{E}^n$ -computable.

We apply that theorem for

$$\xi_{\mathcal{A}} = \mathcal{A}(0,0) + rac{1}{\mathcal{A}(1,1) + rac{1}{\mathcal{A}(2,2) + rac{1}{-1}}},$$

where A is Ackermann's function.

It is well-known that  $\lambda x.A(x,x)$  is not primitive recursive and it is also true that its graph is  $\Delta_0$ -definable hence an  $\mathcal{E}^0$ -relation. So the number  $\xi_A$  is  $\mathcal{E}^2$ -computable (and thus  $\mathcal{E}^n$ -computable for any  $n \ge 2$ ).

To prove that I strengtened the theorem to the following

#### Theorem

For  $n \ge 2$ , if the graph  $\{(k, a_k) | k \in \mathbb{N}\}$  of the continued fraction of  $\xi$  is an  $\mathcal{E}^n$ -relation, then  $\xi$  is  $\mathcal{E}^n$ -computable.

We apply that theorem for

$$\xi_{\mathcal{A}} = \mathcal{A}(0,0) + rac{1}{\mathcal{A}(1,1) + rac{1}{\mathcal{A}(2,2) + rac{1}{-1}}},$$

where A is Ackermann's function.

It is well-known that  $\lambda x.A(x,x)$  is not primitive recursive and it is also true that its graph is  $\Delta_0$ -definable hence an  $\mathcal{E}^0$ -relation. So the number  $\xi_A$  is  $\mathcal{E}^2$ -computable (and thus  $\mathcal{E}^n$ -computable for any  $n \ge 2$ ).

Its continued fraction is, however, not primitive recursive and it does not belong to any of the classes  $\mathcal{E}^n$ .

We still hope that combining some natural condition on the number  $\xi$  with  $\mathcal{E}^n$ -computability will give us low complexity of the continued fraction.

Let **O** be a class of operators. The function  $\theta$  is *uniformly* **O**-computable, if there exists a computing system (F, G, H) for  $\theta$ , such that  $F, G, H \in \mathbf{O}$ . For example, if **O** is the class of all computable operators, then the function  $\theta$  is **O**-computable if and only if it is computable in the classical sense of Grzegorczyk.

Let **O** be a class of operators. The function  $\theta$  is *uniformly* **O**-computable, if there exists a computing system (F, G, H) for  $\theta$ , such that  $F, G, H \in \mathbf{O}$ .

For example, if **O** is the class of all computable operators, then the function  $\theta$  is **O**-computable if and only if it is computable in the classical sense of Grzegorczyk.

There is a more general notion of computability of real functions in which we allow the operators to be partial, that is they might not be defined for some tuples of unary total functions, which are not tuples of names for the arguments of  $\theta$ .

## $\mathcal{F}$ -substitutional operators

We fix a class  $\mathcal{F}$  of total functions. For any  $k, m \in \mathbb{N}$  we define inductively the class of  $\mathcal{F}$ -substitutional operators of type  $\mathcal{T}_1^k \to \mathcal{T}_m$  as follows:

For any *m*-argument projection *h* in N, the operator *F* defined by *F*(*f*<sub>1</sub>,...,*f<sub>k</sub>*) = *h* is *F*-substitutional.

### $\mathcal{F}$ -substitutional operators

We fix a class  $\mathcal{F}$  of total functions. For any  $k, m \in \mathbb{N}$  we define inductively the class of  $\mathcal{F}$ -substitutional operators of type  $\mathcal{T}_1^k \to \mathcal{T}_m$  as follows:

- For any *m*-argument projection *h* in N, the operator *F* defined by *F*(*f*<sub>1</sub>,...,*f<sub>k</sub>*) = *h* is *F*-substitutional.
- For any i ∈ {1,...,k}, if F<sub>0</sub> is an *F*-substitutional operator of type T<sub>1</sub><sup>k</sup> → T<sub>m</sub>, then so is the operator F defined by

$$F(f_1,\ldots,f_k)(n_1,\ldots,n_m)=f_i(F_0(f_1,\ldots,f_k)(n_1,\ldots,n_m)).$$

### $\mathcal{F}$ -substitutional operators

We fix a class  $\mathcal{F}$  of total functions. For any  $k, m \in \mathbb{N}$  we define inductively the class of  $\mathcal{F}$ -substitutional operators of type  $\mathcal{T}_1^k \to \mathcal{T}_m$  as follows:

- For any *m*-argument projection *h* in N, the operator *F* defined by *F*(*f*<sub>1</sub>,...,*f<sub>k</sub>*) = *h* is *F*-substitutional.
- For any i ∈ {1,...,k}, if F<sub>0</sub> is an *F*-substitutional operator of type T<sub>1</sub><sup>k</sup> → T<sub>m</sub>, then so is the operator F defined by

$$F(f_1,\ldots,f_k)(n_1,\ldots,n_m)=f_i(F_0(f_1,\ldots,f_k)(n_1,\ldots,n_m)).$$

 For any r ∈ N and f ∈ T<sub>r</sub> ∩ F, if F<sub>1</sub>,..., F<sub>r</sub> are F-substitutional operators of type T<sub>1</sub><sup>k</sup> → T<sub>m</sub>, then so is the operator F, defined by

$$F(f_1,\ldots,f_k)(n_1,\ldots,n_m) = f(F_1(f_1,\ldots,f_k)(n_1,\ldots,n_m),\ldots,F_r(f_1,\ldots,f_k)(n_1,\ldots,n_m)).$$

The real function  $\theta : D \to \mathbb{R}$ , where  $D \subseteq \mathbb{R}^k$  is uniformly  $\mathcal{F}$ -computable, if there exists a computing system (F, G, H) for  $\theta$ , such that F, G, H are  $\mathcal{F}$ -substitutional operators.

The real function  $\theta: D \to \mathbb{R}$ , where  $D \subseteq \mathbb{R}^k$  is uniformly  $\mathcal{F}$ -computable, if there exists a computing system (F, G, H) for  $\theta$ , such that F, G, H are  $\mathcal{F}$ -substitutional operators. If  $\mathcal{F}$  consists of recursive functions, then the  $\mathcal{F}$ -substitutional operators are computable and so the uniformly  $\mathcal{F}$ -computable real functions are computable in Grzegorczyk's sense.

The real function  $\theta: D \to \mathbb{R}$ , where  $D \subseteq \mathbb{R}^k$  is uniformly  $\mathcal{F}$ -computable, if there exists a computing system (F, G, H) for  $\theta$ , such that F, G, H are  $\mathcal{F}$ -substitutional operators. If  $\mathcal{F}$  consists of recursive functions, then the  $\mathcal{F}$ -substitutional operators are computable and so the uniformly  $\mathcal{F}$ -computable real functions are computable in Grzegorczyk's sense. All elementary functions of calculus are uniformly  $\mathcal{M}^2$ -computable, but restricted to compact subsets of their domains.

The real function  $\theta: D \to \mathbb{R}$ , where  $D \subseteq \mathbb{R}^k$  is uniformly  $\mathcal{F}$ -computable, if there exists a computing system (F, G, H) for  $\theta$ , such that F, G, H are  $\mathcal{F}$ -substitutional operators. If  $\mathcal{F}$  consists of recursive functions, then the  $\mathcal{F}$ -substitutional operators are computable and so the uniformly  $\mathcal{F}$ -computable real functions are computable in Grzegorczyk's sense. All elementary functions of calculus are uniformly  $\mathcal{M}^2$ -computable. but restricted to compact subsets of their domains. The reason is that any real function, computable in Grzegorczyk's sense is uniformly continuous on the bounded subsets of its domain.

The real function  $\theta: D \to \mathbb{R}$ , where  $D \subseteq \mathbb{R}^k$  is uniformly  $\mathcal{F}$ -computable, if there exists a computing system (F, G, H) for  $\theta$ , such that F, G, H are  $\mathcal{F}$ -substitutional operators. If  $\mathcal{F}$  consists of recursive functions, then the  $\mathcal{F}$ -substitutional operators are computable and so the uniformly  $\mathcal{F}$ -computable real functions are computable in Grzegorczyk's sense. All elementary functions of calculus are uniformly  $\mathcal{M}^2$ -computable. but restricted to compact subsets of their domains. The reason is that any real function, computable in Grzegorczyk's sense is uniformly continuous on the bounded subsets of its domain.

This rules out the reciprocal function and the logarithmic function.

The real function  $\theta: D \to \mathbb{R}$ , where  $D \subseteq \mathbb{R}^k$  is uniformly  $\mathcal{F}$ -computable, if there exists a computing system (F, G, H) for  $\theta$ , such that F, G, H are  $\mathcal{F}$ -substitutional operators. If  $\mathcal{F}$  consists of recursive functions, then the  $\mathcal{F}$ -substitutional

operators are computable and so the uniformly  $\mathcal{F}$ -computable real functions are computable in Grzegorczyk's sense.

All elementary functions of calculus are uniformly  $\mathcal{M}^2\text{-}computable,$  but restricted to compact subsets of their domains.

The reason is that any real function, computable in Grzegorczyk's sense is uniformly continuous on the bounded subsets of its domain.

This rules out the reciprocal function and the logarithmic function. If the class  $\mathcal{F}$  contains  $\mathcal{M}^2$  and is closed under substitution, it follows easily that the set of all  $\mathcal{F}$ -computable real numbers is closed under the elementary functions of calculus.

Let  $k \in \mathbb{N}, \theta : D \to \mathbb{R}, D \subseteq \mathbb{R}^k$  and **O** be a class of operators.

Let  $k \in \mathbb{N}, \theta : D \to \mathbb{R}, D \subseteq \mathbb{R}^k$  and **O** be a class of operators.  $\mathcal{F}$ -computable if it is conditionally computable with respect to the class of  $\mathcal{F}$ -substitutional operators.

If the class  ${\mathcal F}$  consists of recursive functions, then the conditionally  ${\mathcal F}$ -computable real functions are computable in the extended sense. All elementary functions of calculus, on their whole domains, are conditionally  ${\mathcal M}^2$ -computable.

Under certain weak assumptions about the class  ${\mathcal F}$  we have

- ► conditional *F*-computability is preserved by substitution,
- ► all conditionally *F*-computable real functions are locally uniformly *F*-computable,

The real function  $\theta: D \to \mathbb{R}, D \subseteq \mathbb{R}^k$  is conditionally

 $\mathcal{F}$ -computable if it is conditionally computable with respect to the class of  $\mathcal{F}$ -substitutional operators.

If the class  ${\mathcal F}$  consists of recursive functions, then the conditionally  ${\mathcal F}$ -computable real functions are computable in the extended sense. All elementary functions of calculus, on their whole domains, are conditionally  ${\mathcal M}^2$ -computable.

Under certain weak assumptions about the class  ${\mathcal F}$  we have

- ► conditional *F*-computability is preserved by substitution,
- ► all conditionally *F*-computable real functions are locally uniformly *F*-computable,
- ► the conditionally *F*-computable real functions with compact domains are uniformly *F*-computable.
